Abstract. In this paper, the blow-up of solutions for the following Dirichlet-Neumann problem to initial nonlinear viscoelastic plate equation with a lower order perturbation of $\vec{p}(x,t)$-Laplacian operator in the presence of time delay is obtained

$$u_{tt} + \Delta^2 u + \Delta_p(x,t) u - \int_0^t g(t-s) \Delta^2 u(s) \, ds - \mu_1 \Delta u_t - \mu_2 \Delta u_t(t-\tau) = u \vert u \vert^{q-2}.$$  

Under suitable conditions on $g$ and the variable exponent of the $\vec{p}(x,t)$-Laplacian operator, we prove that any weak solution with nonpositive initial energy as well as positive initial energy blows up in a finite time.

Keywords: Blow-up, time delay, viscoelasticity, plate equation, nonstandard growth conditions, anisotropy.

2020 Mathematics Subject Classification: 39A10, 67B89.

1 Introduction

In this paper, we consider the Dirichlet-Neumann problem to the following initial nonlinear viscoelastic plate equation with a lower order perturbation of $\vec{p}(x,t)$-Laplacian operator and delay:

$$ \begin{cases} 
  u_{tt} + \Delta^2 u - \Delta_p(x,t) u - \int_0^t g(t-s) \Delta^2 u(s) \, ds - \mu_1 \Delta u_t & x \in \Omega, t > 0, \\
  u = \frac{\partial u}{\partial \nu} = 0, & x \in \Gamma, t > 0, \\
  u(x,0) = u_0(x), u_t(x,0) = u_1(x), & x \in \Omega, \\
  u_t(x,t-\tau) = f_0(x,t-\tau), & x \in \Omega, t \in (0,\tau),
\end{cases} \quad (1.1) $$

where $\Omega$ is a bounded domain in $\mathbb{R}^N$, $n \geq 2$ with Lipschitz-continuous boundary $\Gamma = \partial \Omega$, and $q \geq 2$ is a positive constant

$$\Delta_p(x,t) u = \sum_{i=1}^n \frac{\partial}{\partial x_i} \left( p_i \frac{\partial}{\partial x_i} \right)^{\frac{p_i(x,t)-2}{2}} \frac{\partial u}{\partial x_i}, \quad \vec{p} = (p_1, p_2, \ldots, p_n).$$

$*$Corresponding author. Email: ahlem.merah@univ-tebessa.dz
is the $\mathcal{P}(x,t)$-Laplacian operator. The constant $\mu_1$ is positive and $\mu_2$ is a real number, $\tau > 0$ represents the time delay, $g > 0$ is a memory kernel and $f$ is the forcing term.

In the absence of the viscoelastic term and delay term ($g = 0$ and $\mu_2 = 0$), and with the usual $p$–Laplacian operator $\Delta_p u = \text{div} \left( |\nabla u|^{p-2} \nabla u \right)$, ($p \geq 2$) the equation in (1.1) reduces to the fourth order wave equation

$$u_{tt} + \Delta^2 u_t + \text{div} \left( |\nabla u|^{p-2} \nabla u \right) - \epsilon \Delta u_t = f(x,t,u,u_t),$$

which describes elastoplastic-microstructure flows. The problem (1.2) has been extensively studied (see [5,6,24]), and results concerning solutions existence, nonexistence, and long-time behavior have been proved.

The problem (1.2) without damping or forcing terms is related to the elastoplastic-microstructure models for longitudinal motion of an elastoplastic bar there arises the model equation

$$u_{tt} + u_{xxxx} = a\left( u_x^2 \right)_x + f(x),$$

where $a < 0$ is a constant (see [5]). I. Chueshov and I. Lasiecka in [8,9] discussed

$$u_{tt} + \Delta^2 u + \text{div} \left( |\nabla u|^2 \nabla u \right) - ku_t = \sigma \Delta (u^2) + f(u),$$

and proved the existence of finite-dimensional global attractors. When $\epsilon = 0$ and in the presence of the viscoelastic term ($g \neq 0$) in (1.2), Jorge Silva and Ma [13], established exponential stability of solutions under the condition

$$g'(t) \leq -cg(t), \forall t \geq 0, \ c > 0.$$

Andrade and al. [1] proved exponential stability of solutions for the plate equation with finite memory and $p$-Laplacian. In the presence of the Kelvin–Voigt type dissipation ($\epsilon \neq 0$). In [18], Nakao obtained the existence of a global decaying solution for wave the equation with Kelvin–Voigt dissipation and a derivative nonlinearity. Pukach et al. [19] established sufficient conditions of the nonexistence of solution for a nonlinear hyperbolic equation with memory generalizing the Voigt–Kelvin model. Recently, Cavalcanti et al. [3] considered intrinsic decay rates for the energy of a nonlinear viscoelastic equation modeling the vibrations of thin rods with variable density.

In [2,11], the authors improved the results from [1] by establishing local and global existence, as well as the uniqueness of the weak solution $u(x,t)$ to problem (1.1). To be more important, the authors of [2] and [11] established the local and global existence, uniqueness of weak solutions and the asymptotic behavior of solutions.

Time delays so often arise in many physical, chemical, biological, thermal, and economic phenomena because these phenomena depend not only on the present state but also on the system’s history in a more complicated way. In recent years, many works have been published concerning the wave equation with delay. Kafini and Messaoudi [14] considered the following nonlinear wave equation with delay

$$u_{tt} - \text{div}( |\nabla u|^{m-2} \nabla u) + \mu_1 u_t + \mu_2 u(t - \tau) = b|u|^{p-2}u.$$

They proved the blow-up result of solutions with negative initial energy and $p > m$. Later, Kafini, Messaoudi, and Nicaise [15] considered the blow-up of solutions with negative initial energy for the second-order abstract evolution system with delay. Motivated by previous
works, we study the blow-up of solutions. Recently, Shun-Tang WU [23] investigated the following nonlinear viscoelastic problem with delay

\[ |u_t|^p u_{tt} - \Delta u - \Delta u_{tt} = \int_0^t g(t-s)\Delta u(s)\,ds + \mu_1 u_t + \mu_2 u(t-\tau) = b|u|^{p-2}u. \]

He proved the blow-up result with nonpositive and positive initial energy by modifying the method in [14, 15]. Motivated by previous works. Moreover, we can mention some new related works (see [20]). In this paper, we investigate the problem (1.1) and prove a finite-time blow-up result of solutions. We will see that the direct method introduced and developed by Georgiev and Todorova [12], in 1994, and Salim A. Messaoudi [17] is efficient in our case. Combining this method with some necessary modifications due to the nature of the problem treated here. Our paper is organized as follows: in the next section, we prepare some material needed in our proofs. Section 3 is devoted to the statement and proof of the finite-time blow-up result.

\[ 1 \leq p_i^- = const \leq p_i(x,t) = p(x) \leq p_i^+ = const < \infty, |p_{ii}| \leq C_{p_i}, i = 1, \ldots, n. \] (1.3)

2 The functions space

Let $\Omega \subset \mathbb{R}^n$, $n \geq 2$ be a bounded domain with Lipschitz-continuous boundary $\Gamma = \partial \Omega$, $q \geq 2$ is a positive constant. We denote by $C_0^\infty (\Omega)$ the space of infinitely differentiable functions with a compact support contained in $\Omega$. The inner products and norms in $L^2(\Omega)$ and $H_0^1(\Omega)$ are represented by $(\cdot, \cdot), \|\cdot\|$ respectively and they are given by

\[ (u,v)_\Omega = \int_\Omega u(x)v(x)\,dx \quad \text{and} \quad \|u\|_{L^2(\Omega)}^2 = \|\nabla u\|_{L^2(\Omega)}^2 = \int_\Omega u^2\,dx, \]

\[ \|u\|_{H_0^1(\Omega)}^2 = \|\nabla u\|_{L^2(\Omega)}^2 = \int_\Omega |
abla u|^2\,dx. \]

We recall some known facts from the theory of the Sobolev spaces with variable exponent (see [4, 10]). Let $L^{p(\cdot)}(\Omega)$ be the set of measurable functions $f$ on $\Omega$ such that

\[ A_{p(\cdot)} (f) = \int_\Omega |f(x)|^{p(x)}\,dx < \infty. \]

The set $L^{p(\cdot)}(\Omega)$ equipped with the Luxemburg norm

\[ \|f\|_{p(\cdot),\Omega} = \|f\|_{p(\cdot)} = \inf \left\{ \lambda > 0; A_{p(\cdot)} \left( \frac{f}{\lambda} \right) \leq 1 \right\}, \]

is a Banach space. Let us list some basic properties of the spaces $L^{p(\cdot)}(\Omega)$ used in the rest of this paper. It follows directly from the definition of the norm that

\[ \min \left( \|f\|_{p(\cdot)}^{p^-}, \|f\|_{p(\cdot)}^{p^+} \right) \leq A_{p(\cdot)} (f) \leq \max \left( \|f\|_{p(\cdot)}^{p^-}, \|f\|_{p(\cdot)}^{p^+} \right), \]

where

\[ p^- = \inf_{\Omega} p(x), (p')^- = \inf_{\Omega} p'(x), p' = \frac{p(x)}{p(x) - 1}. \]
We have following Holder-type inequality

$$\int_{\Omega} |fg| \, dx \leq \left( \frac{1}{p} + \frac{1}{p'} \right) \|f\|_{p(\cdot)} \|g\|_{p'(\cdot)} \leq 2 \|f\|_{p(\cdot)} \|g\|_{p'(\cdot)},$$

which holds for all $f \in L^{p(\cdot)}(\Omega), g \in L^{p'(\cdot)}(\Omega)$ with $p(x) \in (1, \infty)$. The Sobolev space $W^{1,p(\cdot)}_0(\Omega)$ with $p(x) \in [p^-, p^+] \subset (1, \infty)$ is defined by

$$W^{1,p(\cdot)}_0(\Omega) = \left\{ u \in L^{p(\cdot)}(\Omega) : |\nabla u|^{p(x)} \in L^1(\Omega), u = 0 \text{ on } \partial \Omega \right\},$$

with

$$\|u\|_{W^{1,p(\cdot)}_0(\Omega)} = \sum_i \|D_i u\|_{p(\cdot)} + \|u\|_{p(\cdot)\Omega}$$

Let $p(x)$ be log-continuous in $\Omega, \forall x, y \in \Omega$ such that $|x - y| < \frac{1}{2}$

$$|p(x) - p(y)| \leq \omega(|x - y|) \text{ with } \lim_{t \to 0^+} \left( \omega(t) \ln \frac{1}{t} \right) = C < \infty \quad (2.2)$$

• Throughout the paper we use the following properties of the functions from the spaces $W^{1,p(\cdot)}_0(\Omega)$:

  • if condition (2.2) is fulfilled, then $C^\infty_0(\Omega)$ is dense in $W^{1,p(\cdot)}_0(\Omega)$ and the space $W^{1,p(\cdot)}_0(\Omega)$ can be defined as the closure of $C^\infty_0(\Omega)$ with respect to the norm (2.1) see [3, 11, 22, 27],

  • if $p(x) \in C^0(\Omega)$, the space $W^{1,p(\cdot)}_0(\Omega)$ is separable and reflexive,

  • if $1 < q(x) \leq \sup_\Omega q(x) < \inf_\Omega p_+(x)$ with

    $$p_+(x) = \begin{cases} \frac{p(x)}{n-p(x)} & \text{if } p(x) < n, \\ \infty & \text{if } p(x) < n, \end{cases}$$

    then the embedding $W^{1,p(\cdot)}_0(\Omega) \hookrightarrow L^q(\Omega)$ is continuous and compact if $q < p_+(x)$.

### 3 Anisotropic spaces of functions depending on $x$ and $t$

Consider the cylinder

$$Q_T = \{ z = (x, t) : x \in \Omega, t \in [0, T] \}$$

of a definite height $T$. Wherever it doesn’t cause a confusion, we will use the notation $z = (x, t)$ for the points of the cylinder $Q_T$ and drop the sub-index $T$. The lateral boundary of the cylinder $Q$ is $\Gamma = \partial \Omega \times (0, T)$. If $X$ is a Banach space, then we denote by $L^p(0, T, X), 1 \leq p \leq \infty$ the Banach space of measurable vector valued functions $u : (0, T) \to X$, such that

$$\|u(t)\|_{L^p(0,T,X)} = \left[ \int_0^T \|u(t)\|^p_X \, dt \right]^{\frac{1}{p}}, 1 \leq p < \infty,$$

$$\|u(t)\|_{L^p(0,T,X)} = \text{ess sup}_{0 \leq t \leq T} \|u(t)\|_X, p = \infty.$$

We will use the following function spaces (see [3, 4])

$$W = W(Q_T) = \left\{ u : u \in L^2(0, T, H^1_0(\Omega)) ; u_t \in L^2 (0, T, H^1_0(\Omega)) \right\},$$
\[ W^\infty = W^\infty (Q_T) = \{ u : u \in W (Q_T); u \in L^\infty (0, T, H^2_0 (\Omega)) ; u_t \in L^\infty (0, T, L^2 (\Omega)) \} \]
endowed with the norms
\[ \| u \|_{W(Q)} = \| u \|_{W(Q_T)} + \| u \|_{L^\infty (0,T,H^2_0 (\Omega))} + \| u \|_{L^\infty (0,T,L^2 (\Omega))} \]
Note that \( \| u \|_{W(Q)} \) may be used in the equivalent form
\[ \| u \|_{W(Q)} = \| u \|_{L^2(Q)} + \| \Delta u \|_{L^2(Q)} + \| \nabla u \|_{L^2(Q)}. \]
Let \( p(z) = \overrightarrow{p} = (p_1(z), ... , p_n(z)) \) be a vector-valued function defined on \( Q = Q_T \). We assume that the components of \( p(z) \) satisfy the conditions
\[ \begin{aligned}
&\{ p_i(z) \text{ are measurable functions defined on } Q; \\
&p_i(z) : Q \rightarrow (1, \infty), \\
&\text{there exist constants } p_i^-, p_i^+ \text{ such that } \\
p_i(z) \in [p_i^-, p_i^+] \subseteq [p^-, p^+] \subset (1, \infty). 
\end{aligned} \]
(3.1)
For every fixed \( t \in (0, T) \), we introduce the anisotropic Banach space
\[ V_t (\Omega) = \left\{ u (x) : u (x) \in L^2 (\Omega) \cap W^{1,1}_0 (\Omega), |D_i u (x)|^{p_i(x,t)} \in L^1 (\Omega) \right\}, \]
\[ \| u \|_{V_t(\Omega)} = \| u \|_{2,\Omega} + \sum_{i=1}^n \| D_i u \|_{p_i(\cdot,t),\Omega} + \| \Delta u \|_{2,\Omega}. \]
The elements of the space \( V_t (\Omega) \) depend on \( t \in (0, T) \) as a parameter and the norms \( \| u \|_{V_t(\Omega)} \) are functions of \( t \) by \( V_t (\Omega) \) we denote the dual space to \( V_t (\Omega) \) with respect to the scalar product in \( L^2 (\Omega) \).
For every \( t \in (0, T) \) the inclusion
\[ V_t (\Omega) \subset X = W^{1,p^+}_0 (\Omega) \cap L^2 (\Omega), \]
holds. Thus, \( V_t (\Omega) \) is reflexive and separable as a closed subspace of \( X \).
By \( W^p_\overrightarrow{p} (Q) \) we denote the Banach space
\[ W^p_\overrightarrow{p} (Q) = \left\{ u : (0, T) \rightarrow V_t (\Omega) \left| u \in L^2 (\Omega), |D_i u (x)|^{p_i(x,t)} \in L^1 (\Omega), u = 0 \text{ on } \Gamma \right. \right\}, \]
\[ \| u \|_{W^p_\overrightarrow{p} (Q)} = \| u \|_{2,Q} + \sum_{i=1}^n \| D_i u \|_{p_i(\cdot),Q} . \]
\( \left( W^p_\overrightarrow{p} (Q) \right)' \) is the dual of \( W^p_\overrightarrow{p} (Q) \) (the space of linear functionals over \( W (Q) \)). We have the following characterization
\[ \omega \in \left( W^p_\overrightarrow{p} (Q) \right)' \leftrightarrow \left\{ \exists (\omega_0, \omega_1, ..., \omega_n), \omega_0 \in L^2 (\Omega), \omega_i \in L^{p^+}_{\overrightarrow{p}} (Q), \forall \phi \in W (Q), \langle \omega, \phi \rangle = \int_Q (\omega_0 \phi + \sum_{i=1}^n \omega_i D_i \phi) dz. \right\} \]
The norm in \( W' (Q) \) is defined by
\[ \| u \|_{W' (Q)} = \sup \left\{ \langle u, \phi \rangle \big| \phi \in W (Q), \| \phi \|_{W(Q)} \leq 1 \right\}. \]
Let \( \nu = (\nu_1, ..., \nu_n) \) be a vector-valued function defined in \( Q \). Assume that \( p_i(z) \) satisfy conditions 3.1. Introduce the modular
\[
A_{p,(\cdot)}(\nu) = \sum_{i=1}^{n} \int_{Q} |\nu_i|^{p_i(z)} \, dz.
\]
For the elements of \( W^{p} (Q) \) the following inequality
\[
\min \left\{ \sum_{i=1}^{n} \left| D_i u \right|^{p_i(z)}_{p_i(\cdot),Q}, \sum_{i=1}^{n} \left| D_i u \right|^{p_i(z)}_{p_i(\cdot),Q} \right\}
\leq A_{p(\cdot),Q}(\nabla u)
\leq \max \left\{ \sum_{i=1}^{n} \left| D_i u \right|^{p_i(z)}_{p_i(\cdot),Q}, \sum_{i=1}^{n} \left| D_i u \right|^{p_i(z)}_{p_i(\cdot),Q} \right\},
\]
holds. We also use the space
\[
W_{p}^{\infty} (Q) = \left\{ u : u \in W_{p} (Q), \left| u_{x_i} \right|^{p_i(x,t)} \in L_{\infty} (0, T, L^1 (\Omega)) \right\}.
\]
Note that
\[
W^\infty (Q) \subseteq W_{p}^{\infty} (Q) \text{ if } p^+ \leq \frac{2n}{n-2}.
\]
We introduce also the functional space
\[
U (Q) = W (Q) \cap W_{p} (Q),
\]
endowed with the norm
\[
\| u \|_{U(Q)} = \| u \|_{W(Q)} + \| u \|_{W_{p} (Q)},
\]
and
\[
U^{\infty} (Q) = W^\infty (Q) \cap W_{p}^{\infty} (Q).
\]
For the exponents \( p_i(x,t) \) depending on \((x,t) \in Q\) we will use the notation \( p_i \in C_{\log} (Q) \) if \( p_i \) satisfies condition (3.1) in the cylinder \( Q \) and
\[
C_{\log} (Q) := \left\{ p_i \in C^0 (\overline{Q}) \bigg| \begin{array}{l}
\forall z = (x,t), \xi = (y, \tau) \in Q \\
\text{such that } |x - y| + |t - \tau| \leq \frac{1}{2}, \\
|p_i(z) - p_i(\xi)| \leq \omega (|z - \xi|)
\end{array} \right\},
\]
with a continuous function \( \omega \) satisfying the condition
\[
\lim_{\tau \rightarrow 0} \omega (\tau) \ln \frac{1}{\tau} = C < +\infty.
\]

4 Statement of the problem

We consider a class of nonlinear viscoelastic plate equations with delay and with \( \bar{p}(x,t) \)-Laplacian type
\[
\begin{cases}
\frac{\partial ^2 u}{\partial t^2} + \Delta^2 u (t) - \Delta p_i(x,t) u - \int_0^t g(t - s) \Delta^2 u (s) \, ds - \mu_1 \Delta u_i (t) \\
- \mu_2 \Delta z (1,t) = u |u|^{q-2}, \quad \text{in } \Omega \times \mathbb{R}^+,
\end{cases}
\]
\[
\frac{\partial u}{\partial v} = 0, \quad \text{in } \partial \Omega \times \mathbb{R}^+,
\]
\[
\frac{\partial u}{\partial v} = 0, \quad \text{in } \partial \Omega \times \mathbb{R}^+.
\]
\[ u(x,0) = u_0(x), \quad u_t(x,0) = u_1(x), \quad x \in \Omega, \quad (4.3) \]
\[ u_t(x,t-\tau) = f_0(x,t-\tau), \quad \text{in} \quad (0, \tau), \quad (4.4) \]

Here \( \mu_1 \) is a positive constant, \( \mu_2 \) is a real number, \( \tau > 0 \) represents the time delay, and \( g \) is a positive function.

\[ \Delta \bar{p}^i(x,t)^H = \sum_{i=1}^n \frac{\partial}{\partial x_i} \left( \frac{\partial u}{\partial x_i} \right) |\nabla u|^{p_i-2} \frac{\partial u}{\partial x_i}, \quad \bar{p} = (p_1, p_2, \ldots, p_n), \]

under conditions
\[ 1 \leq p_i^- = \text{const} \leq p_i(x,t) = p(x) \leq p_i^+ = \text{const} < q < \infty, |p_i| \leq C p_i, i = 1, \ldots, n. \quad (4.5) \]

Assume that \( g : \mathbb{R}_+ \rightarrow \mathbb{R}_+ \) is a nonincreasing and differentiable function satisfying
\[ g(0) > 0, g(s) \geq 0, 1 - \int_0^\infty g(s) ds := \gamma > 0, \quad (4.6) \]

and that \( \mu_1 \) and \( \mu_2 \) satisfy
\[ |\mu_2| < \mu_1, \quad (4.7) \]

let \( \beta > 0 \) be the constant satisfying
\[ \|v\|_p \leq \beta \|\nabla v\|. \quad (4.8) \]

By using the direct calculations, we have
\[ \int_0^t g(t-s) (\Delta u_t(t), \Delta u(s)) ds = -\frac{1}{2} \frac{d}{dt} \left\{ (g \circ \Delta u)(t) - \left( \int_0^t g(s) ds \right) \|\Delta u\|^2 \right\} - \frac{1}{2} g(t) \|\Delta u\|^2 + \frac{1}{2} (g \circ \Delta u)(t), \quad (4.9) \]

where
\[ (g \circ \Delta u)(t) = \int_0^t g(t-s) \|\Delta u(s) - \Delta u(t)\|^2 ds. \]

We refer the reader to the work of Nicaise and Pignotti [19] for the existence of solutions to nonlinear problems with delay. Let us introduce the function
\[ z(x,\rho,t) = u_t(x,t-\tau \rho), x \in \Omega, \rho \in (0,1), t > 0. \]

Then, the problem \((4.1)-(4.4)\) is equivalent to
\[
\begin{cases}
    u_{tt} + \Delta^2 u(t) - \Delta \bar{p}(x,t) = \int_0^t g(t-s) \Delta^2 u(s) ds - \mu_1 \Delta u_t(t) - \mu_2 \Delta z(1,t) = u |u|^{q-2}, & \text{in} \ (0,1) \times (0,\infty), \\
    \tau z_t(x,\rho,t) + z_\rho(x,\rho,t) = 0, & \text{in} \ (0,\infty), \\
    z(0,t) = u_t(t), & \text{in} \ (0,1), \\
    z(\rho,0) = f_0(-\tau \rho), & \text{on} \ \partial \Omega \times (0,\infty), \\
    u = \frac{\partial}{\partial \nu} = 0, & \text{on} \ \partial \Omega \times (0,\infty), \\
    u(x,0) = u_0(x), \quad u_t(x,0) = u_1(x), & \text{in} \ \Omega. \\
\end{cases} \quad (4.10)
\]

We first state a local existence theorem that can be established by combining the arguments of related works [7,8].
Proof. Multiplying (4.10) by \( C \) where \( C \) is the solution of (4.10), then there exists \( C > 0 \) such that

\[
C \leq u \leq C \quad \text{for } u \text{ is the solution of (4.10)},
\]

where \( 2 \leq p_i < q \leq \infty \), for \( n = 1, 2 \).

Then, for every \((u_0, u_1) \in H^1_0(\Omega) \times L^2(\Omega)\), there exists a unique local solution in the class \( u \in C([0, T); H^1_0(\Omega)) \), \( u_t \in C([0, T); L^2(\Omega)) \cap L^2(\Omega \times [0, T)) \) for some \( T > 0 \). Our aim is to investigate a blow-up result for problem (4.10). We define the energy associated with problem (4.10) by

\[
E(t) = \frac{1}{2} \| u_t(t) \|_2^2 + \frac{1}{2} \left( 1 - \int_0^t g(s)ds \right) \| \Delta u \|_2^2 + \sum_{i=1}^n \int_{\Omega} \frac{1}{p_i} | u_{x_i} |^{p_i} dx + \frac{1}{2} (g \circ \Delta u)(t) + \frac{\zeta}{2} \int_0^1 \| \nabla z(x, \rho, t) \|_2^2 d\rho - \frac{1}{q} \| u \|_q^q,
\]

(4.12)

where \( \tau | \mu_2 | < \zeta < \tau (2|\mu_1 | - |\mu_2 |) \).

(4.13)

Note that this choice of \( \zeta \) is possible from Assumption (4.7).

Lemma 4.2. For \( u \) is the solution of (4.10), then there exists \( C_0 \geq 0 \) such that

\[
E'(t) \leq -C_0 \left( \| \nabla u_t \|_2^2 + \| \nabla z(1, t) \|_2^2 \right) - \frac{1}{2} g(t) \| \Delta u \|_2^2 + \frac{1}{2} \left( g' \circ \Delta u \right)(t) \leq 0
\]

(4.14)

Proof. Multiplying (4.10) by \( u_t \) and using (4.9), we obtain

\[
\begin{aligned}
&\frac{d}{dt} \left\{ \frac{1}{2} \| u_t(t) \|_2^2 + \frac{1}{2} \left( 1 - \int_0^t g(s)ds \right) \| \Delta u \|_2^2 + \sum_{i=1}^n \int_{\Omega} \frac{1}{p_i} | u_{x_i} |^{p_i} dx \\
&+ \frac{1}{2} (g \circ \Delta u)(t) - \frac{1}{q} \| u \|_q^q \right\} \\
&= \frac{1}{2} \left( g' \circ \Delta u \right)(t) - \frac{1}{2} g(t) \| \Delta u \|_2^2 - \mu_1 \| \nabla u_t \|_2^2 - \mu_2 \int_{\Omega} \nabla u_t \nabla z(1, t) dx \\
&= \frac{1}{2} \left( g' \circ \Delta u \right)(t) - \frac{1}{2} g(t) \| \Delta u \|_2^2 - \mu_1 \| \nabla u_t \|_2^2 - \mu_2 \int_{\Omega} \nabla u_t \nabla z(1, t) dx
\end{aligned}
\]

(4.15)

From (4.12) and (4.15), we see that

\[
E'(t) = -\frac{1}{2} g(t) \| \Delta u \|_2^2 + \frac{1}{2} \left( g' \circ \Delta u \right)(t) - \mu_1 \| \nabla u_t \|_2^2 - \mu_2 \int_{\Omega} \nabla u_t \nabla z(1, t) dx - \zeta \int_{\Omega} \int_0^1 \Delta z(x, \rho, t) z_t(x, \rho, t) d\rho dx
\]

(4.16)

We estimate the last terms of the right-hand side of (4.16). From the second equation of (4.10), we get

\[
\begin{aligned}
\zeta \int_{\Omega} \int_0^1 \Delta z(x, \rho, t) z_t(x, \rho, t) d\rho dx &= \frac{\zeta}{2} \int_{\Omega} \int_0^1 \frac{\partial}{\partial \rho} | \nabla z(x, \rho, t) |^2 d\rho dx \\
&= \frac{\zeta}{2} \left( \| \nabla u_t \|_2^2 - \| \nabla z(1, t) \|_2^2 \right)
\end{aligned}
\]

(4.17)

Using Young’s inequality, we have

\[
\mu_2 \int_{\Omega} \nabla u_t \nabla z(1, t) dx \leq \frac{|\mu_2|}{2} \| \nabla u_t \|_2^2 + \frac{1}{2} \| \nabla z(1, t) \|_2^2
\]

(4.18)

Combining (4.16), (4.17), and (4.18) we obtain

\[
E'(t) \leq -C_0 \left( \| \nabla u_t \|_2^2 + \| \nabla z(1, t) \|_2^2 \right) - \frac{1}{2} g(t) \| \Delta u \|_2^2 + \frac{1}{2} \left( g' \circ \Delta u \right)(t),
\]

where \( C_0 = \min \left\{ \mu_1 - \frac{1}{2} \zeta, \frac{\zeta}{2}, \frac{\mu_2}{2} \right\} \), which is positive by (4.13) \( \square \)
Next, we define the functionals

\[
I(t) = \left(1 - \int_0^t g(s)ds\right) \|\Delta u\|_2^2 + \sum_{i=1}^n \int_\Omega |u_{x_i}|^{p_i} \, dx + (g \circ \Delta u)(t) - \|u\|_q^q
\]

\[
J(t) = \frac{1}{2} \left(1 - \int_0^t g(s)ds\right) \|\Delta u\|_2^2 + \sum_{i=1}^n \int_\Omega \frac{|u_{x_i}|^{p_i}}{q_i} \, dx + \frac{1}{2} (g \circ \Delta u)(t) - \frac{1}{q} \|u\|_q^q,
\]

for \(t \geq 0\), we denote

\[
d(t) = \inf_{u \in L^q_0(\Omega), u \neq 0} \sup_{\lambda \geq 0} J(\lambda u).
\]

Then, similar to the work of Liu and Yu [16], we can prove the following lemmas.

**Lemma 4.3.** for \(t \geq 0\), we have

\[
0 < d_1 \leq d(t) \leq \sup_{\lambda \geq 0} J(\lambda u),
\]

where

\[
d_1 = \sum_{i=1}^n \left[ p_i^+ (q-2) \left(\frac{1}{B_i} \right)^{\frac{q_i}{q_i-2}} + 2q-2p_i^+ \left(\frac{1}{B_i} \right)^{\frac{q_i}{q_i-2}} \right] p_i^+(q-2)
\]

\[
d_2 = \sup_{\lambda \geq 0} J(\lambda u) = \sum_{i=1}^n \left[ p_i^+ (q-2) \left(\frac{1}{B_i} \right)^{\frac{q_i}{q_i-2}} \right] p_i^+(q-2)
\]

\[+ \sum_{i=1}^n \frac{2q-2p_i^+}{2q_i} \left(\frac{1}{B_i} \right)^{\frac{q_i}{q_i-2}} \frac{q_i^q}{2q_i},
\]

**Lemma 4.4.** Suppose that (4.6), (4.7), and (4.11) hold. For any fixed number \(\delta < 1\) assume that \((u_0, u_1) \in L^1_0(\Omega) \times L^2(\Omega)\) and satisfy

\[
I(0) < 0, E(0) \leq \delta d_1.
\]

Assume further that \(g\) satisfies

\[
\int_0^t g(s)ds < \sum_{i=1}^n \left[ p_i^-(q-2) \left(1+\delta\right)^{\frac{1}{(1+\delta)(q-2)+2p_i^- (1-\delta)}} \right],
\]

where \(\delta = \max \{0, \delta\}\). Then, for some \(T > 0\), we have \(I(t) < 0\) for all \(t \in [0, T]\), and

\[
d_1 < \sum_{i=1}^n \frac{p_i^-(q-2)}{2q_i p_i^-} \left[ \left(1 - \int_0^t g(s)ds\right) \|\Delta u\|_2^2 + (g \circ \Delta u)(t) \right]
\]

\[+ \sum_{i=1}^n \frac{2q-2p_i^+}{2q_i} \left(\frac{1}{B_i} \right)^{\frac{q_i}{q_i-2}} \|u\|_q^q
\]

\[< \sum_{i=1}^n \frac{p_i^+(q-2)}{2q_i p_i^-} + 2q-2p_i^+ \left(\frac{1}{B_i} \right)^{\frac{q_i}{q_i-2}} \|u\|_q^q
\]

\[< \sum_{i=1}^n \frac{q(p_i^+ + 2 - 4p_i^-)}{2q_i p_i^-} \|u\|_q^q, t \in [0, T],
\]

we set

\[
H(t) = \hat{\delta} d_1 - E(t).
\]

Using (4.14), we see that

\[
H'(t) = -E'(t) \geq C_0 \left(\|\nabla u_t\|_2^2 + \|\nabla z(1,t)\|_2^2\right) \geq 0,
\]
and \( H(t) \) is an increasing function. From (4.12), (4.19), and (4.21), we obtain
\[
0 < H(0) \leq H(t) \leq \hat{d}_1 + \frac{1}{q} \| u \|_q^q \leq q_0 \| u \|_q^q, \quad t \in [0, T),
\] (4.24)

where \( q_0 = \sum_{i=1}^n \frac{q_i (p_i^+ + 2) - 4 p_i^+}{2 p_i^-} + \frac{1}{q} \). Moreover, similar to the work of Messaoudi [14] we can get the following lemma that is needed later.

**Lemma 4.5.** Let the conditions of Lemma 3 hold. Then, we have, for any \( 2 \leq s \leq q \)
\[
\| \nabla u \|_q^s \leq C \left( -H(t) \right) - \| u_t (t) \|_2^2 - \sum_{i=1}^n \int_\Omega |u_{x_i}| p_i dx - (g \circ \Delta u)(t)
\]
\[+ \| u \|_q^q - \int_0^1 \| \nabla z (x, \rho, t) \|_2^2 d\rho \right),
\] (4.25)

where \( C \) is a positive constant depending on \( p_i^+, \hat{\zeta}, \gamma, B, q \).

**Proof.** From (4.8), there exists a positive constant \( c_0 \) such that
\[
\| \nabla u \|_q^s \leq c_0 \left( \| u \|_q^q + \| \Delta u \|_2^2 \right), \text{ for any } 2 \leq s \leq q,
\] (4.26)

where \( c_0 = \max \{1, B^2\} \). Using (4.6), (4.12), (4.22), and (4.24), we know that
\[
\frac{\gamma}{2} \| \Delta u (t) \|_2^2 \leq -H(t) - \frac{1}{2} \| u_t (t) \|_2^2 - \sum_{i=1}^n \int_\Omega \frac{1}{p_i} |u_{x_i}| p_i dx - \frac{1}{2} (g \circ \Delta u)(t)
\]
\[-\frac{\hat{\zeta}}{2} \int_0^1 \| \nabla z (x, \rho, t) \|_2^2 d\rho + q_0 \| u \|_q^q
\] (4.27)

From (4.26) and (4.27), we find that (4.25) holds. \(\square\)

## 5 A blow-up result

In this section, we prove that the solutions for the problem (4.1)-(4.4) blow up in a finite time when the initial energy lies in nonpositive as well as positive. We use the improved method of Liu and Yu [16].

**Theorem 5.1.** Let the conditions of Lemma 3 hold. Then, the solution of problem (4.1)-(4.4) blows up in a finite time.

**Proof.** To prove this theorem, we adapt the idea given in the works of Messaoudi and Kafini [14, 17]. Let us define
\[
L(t) = H^{1-\sigma_1} (t) + \varepsilon (u(t), u_t (t)) + \varepsilon > 0,
\] (5.1)

where
\[
0 < \sigma_1 < \min \left\{ \frac{q (p_i^+ + 2) - 4 p_i^+}{2 q p_i^-}, \frac{q (p_i^+ + 2) - 4 p_i^+}{q p_i^-} \right\}.
\] (5.2)

From (4.10) and Young’s inequality, we have
\[
L' (t) = (1 - \sigma_1) H^{-\sigma_1} (t) H' (t) + \varepsilon \| u_t (t) \|_2^2 - \varepsilon \| \Delta u \|_2^2 - \varepsilon \sum_{i=1}^n \int_\Omega |u_{x_i}| p_i dx
\]
\[+ \varepsilon \int_0^t g(t - s) (\Delta u (t), \Delta u (s)) ds - \varepsilon \mu_1 \int_\Omega \nabla u_t (t) \nabla u (t) dx
\]
\[+ \varepsilon \| u \|_q^q - \varepsilon \mu_2 \int_\Omega \nabla u \nabla z (1, t) dx.
\] (5.3)
Using Young’s inequality and (4.23), we obtain, for any \( \beta > 0 \),
\[
\mu_1 \varepsilon \int_{\Omega} \nabla u_t(t) \nabla u(t) \, dx + \mu_2 \varepsilon \int_{\Omega} \nabla u \nabla z(1, t) \, dx \\
\leq \left( \frac{\mu_1^2 \beta \varepsilon}{2} + \frac{\mu_2^2 \beta \varepsilon}{2} \right) \| \nabla u \|_2^2 + \frac{\varepsilon}{2C_0} \beta^{-2} \left\{ \| \nabla u \|_2^2 + \| \nabla (1, t) \|_2^2 \right\} \\
\leq \left( \frac{\mu_1^2 \beta \varepsilon}{2} + \frac{\mu_2^2 \beta \varepsilon}{2} \right) \| \nabla u \|_2^2 + \frac{\varepsilon}{2C_0} \beta^{-2} H'(t). \tag{5.4}
\]

Since, for some number \( \eta > 0 \),
\[
\int_0^t g(t-s) (\Delta u(t), \Delta u(s)) \, ds = \int_0^t g(t-s) (\Delta u(s) - \Delta u(t), \Delta u(t)) \, ds \\
+ \int_0^t g(t-s) \| \Delta u \|_2^2 \, ds \\
\geq \left( 1 - \frac{1}{4\eta} \right) \int_0^t g(s) \, ds \| \Delta u \|_2^2 - \eta \left( g \circ \Delta u \right)(t),
\]
we get from (5.3) and (5.4) that
\[
L'(t) \geq \left( 1 - \sigma_1 \right) H^{-\alpha}(t) H'(t) + \varepsilon \| u_t(t) \|_2^2 - \varepsilon \| \Delta u \|_2^2 - \varepsilon \sum_{i=1}^n \int_{\Omega} | u_{x_i} | q_i' \, dx \\
+ \varepsilon \left( 1 - \frac{1}{4\eta} \right) \int_0^t g(s) \, ds \| \Delta u \|_2^2 - \varepsilon \mu_1 \int_{\Omega} \nabla u_t(t) \nabla u(t) \, dx \\
+ \varepsilon \| u \|_q^q - \varepsilon \mu_2 \int_{\Omega} \nabla u \nabla z(1, t) \, dx.
\]

Applying (4.12) and (4.22), we see that
\[
L'(t) \geq \left\{ \left( 1 - \sigma_1 \right) H^{-\alpha}(t) - \frac{\varepsilon}{2C_0} \beta^{-2} \right\} H'(t) + \varepsilon \left( 1 + \frac{q}{2} \right) \| u_t(t) \|_2^2 \\
+ \varepsilon \left( \frac{q}{2} - \eta \right) \left( g \circ \Delta u \right)(t) + \varepsilon \sum_{i=1}^n \left( \frac{q}{p_i} - 1 \right) \int_{\Omega} | u_{x_i} | q_i' \, dx \\
+ \varepsilon \left( \frac{q}{2} - \eta \right) \left( 1 + \frac{1}{4\eta} \right) \int_0^t g(s) \, ds \| \Delta u \|_2^2 \\
+ \frac{\varepsilon q \eta}{2} \int_0^t \| \nabla z(x, \rho, t) \|_2^2 \, d\rho - \left( \frac{\mu_1^2}{2} + \frac{\mu_2^2}{2} \right) \beta^2 \varepsilon \| \nabla u \|_2^2 \\
+ \varepsilon q H(t) - \varepsilon \eta d_1. \tag{5.5}
\]

Using (4.20), (4.21), and (5.5), we find that, for some \( \eta \) with \( 0 < \eta < \lambda_1 \left( \frac{q-2}{2\lambda_1} - \delta \right) + 1 \),
\[
L'(t) \geq \left\{ \left( 1 - \sigma_1 \right) H^{-\alpha}(t) - \frac{\varepsilon}{2C_0} \beta^{-2} \right\} H'(t) + \varepsilon \left( 1 + \frac{q}{2} \right) \| u_t(t) \|_2^2 \\
+ \varepsilon \left( \lambda_1 \left( \frac{q-2}{2\lambda_1} - \delta \right) + (1 - \eta) \right) \left( g \circ \Delta u \right)(t) \\
+ \varepsilon \left( \lambda_1 \left( \frac{q-2}{2\lambda_1} - \delta \right) \right) \left( 1 + \frac{1}{4\eta} \right) \int_0^t g(s) \, ds \| \Delta u \|_2^2 \\
- \left( \frac{\mu_1^2}{2} + \frac{\mu_2^2}{2} \right) \beta^2 \varepsilon \| \nabla u \|_2^2 + \varepsilon q H(t) + \frac{\varepsilon q \eta}{2} \int_0^t \| \nabla z(x, \rho, t) \|_2^2 \, d\rho \\
+ \varepsilon \sum_{i=1}^n \left( \frac{1}{p_i} - \frac{1}{2} \right) + \lambda_2 \left( \frac{q-2}{2\lambda_2} - \delta \right) \int_{\Omega} | u_{x_i} | q_i' \, dx, \tag{5.6}
\]

\]
Substituting this into (5.6),
\begin{equation}
\frac{\varepsilon}{2C_0} \beta^{-2} \left\{ (1 - \sigma_i) \right\} H^{-\sigma_i}(t) - (1 - \eta) > 0,
\end{equation}
where
\begin{align*}
a_1 &= \lambda_1 \left( \frac{q^2 - 2\lambda_1}{2\lambda_1} - \delta \right) + (1 - \eta) > 0, \\
a_2 &= \lambda_2 \left( \frac{q^2 - 2\lambda_1}{2\lambda_1} - \delta \right) - \left( \lambda_1 \left( \frac{q^2 - 2\lambda_1}{2\lambda_1} - \delta \right) + \frac{1}{4\eta} \right) f_0^t g(s) ds > 0, \\
a_3 &= \sum_{i=1}^n q \left( \frac{1}{p_i} - \frac{1}{2} \right) + \lambda_2 \left( \frac{q^2 - 2\lambda_1}{2\lambda_1} - \delta \right) > 0, \\
\lambda_1 &= \sum_{i=1}^n \frac{p_i(q^2 - 2\lambda_1)}{2p_i} > 0, \lambda_2 = \sum_{i=1}^n \frac{2q - p_i}{2p_i} > 0.
\end{align*}

Take $\beta$ so that $\beta = (kH^{-\sigma_i}(t))^{-\frac{1}{2}}$, for large $k$ to be specified later. Exploiting (4.24) and the inequality
\begin{equation}
\|u\|_{2,\Omega}^2 \leq C_1 \|u\|_{\tilde{q},\Omega}^2,
\end{equation}
we see that
\begin{equation}
\beta^2 \|\nabla u\|_{\tilde{q}}^2 \leq k^{-1} C_1 \|\nabla u\|_{\tilde{q},\Omega}^{q\sigma_i + 2}
\end{equation}
Substituting this into (5.6),
\begin{align*}
L'(t) &\geq \left\{ (1 - \sigma_i) - \frac{\varepsilon}{2C_0} k \right\} H^{-\sigma_i}(t) H'(t) + \varepsilon \left( 1 + \frac{q}{2} \right) \|u_t(t)\|_{\tilde{q}}^2 \\
&\quad + \varepsilon a_1 (g \circ \Delta u)(t) + \varepsilon a_2 \|\Delta u\|_{\tilde{q}}^2 + \varepsilon a_3 \int_{\Omega} |u_{x_i}|^{p_i} dx \\
&\quad + \frac{\tilde{C}q}{2} \int_0^1 \|\nabla z(x, \rho, t)\|_{\tilde{q}}^2 d\rho - c k^{-1} C_2 \|\nabla u\|_{\tilde{q},\Omega}^{q\sigma_i + 2} + \varepsilon q H(t)
\end{align*}
where $C_2 = \frac{(\hat{p}^2 + \hat{p}^2) C_1 q_0^{\tilde{q}}}{2}$. From (5.2), and Lemma 4, for $S = q\sigma_i + 2 \leq q$, we arrive at
\begin{equation}
\|\nabla u\|_{\tilde{q},\Omega}^{q\sigma_i + 2} \leq c \left( -H(t) - \|u_t(t)\|_{\tilde{q}}^2 - \sum_{i=1}^n \int_{\Omega} |u_{x_i}|^{p_i} dx - (g \circ \Delta u)(t) \right)
\end{equation}
Then, we have
\begin{align*}
L'(t) &\geq \left\{ (1 - \sigma_i) - \frac{\varepsilon}{2C_0} k \right\} H^{-\sigma_i}(t) H'(t) + \varepsilon \left( 1 + \frac{q}{2} + c k^{-1} C_2 \right) \|u_t(t)\|_{\tilde{q}}^2 \\
&\quad + \varepsilon (a_1 + c k^{-1} C_2) (g \circ \Delta u)(t) + \varepsilon (a_3 + c k^{-1} C_2) \int_{\Omega} |u_{x_i}|^{p_i} dx \\
&\quad + \varepsilon a_2 \|\Delta u\|_{\tilde{q}}^2 + \varepsilon \left( \frac{\tilde{C}q}{2} + c k^{-1} C_2 \right) \int_0^1 \|\nabla z(x, \rho, t)\|_{\tilde{q}}^2 d\rho \\
&\quad - c k^{-1} C_2 \|u\|_{\tilde{q},\Omega}^{q\sigma_i} + \varepsilon \left( q + c k^{-1} C_2 \right) H(t).
\end{align*}
(5.8)
Subtracting and adding $\varepsilon \theta H(t)$ on the right-hand side of (5.7) and using (4.12) and (4.22), we deduce
\[
L'(t) \geq \left\{ (1 - \sigma_i) - \frac{\varepsilon}{2C_0} k \right\} H^{-\sigma_i}(t) H'(t) + \varepsilon \left( 1 + \frac{q}{2} - \frac{\theta}{2} + ck^{-1}C_2 \right) \| u_i(t) \|_2^2 \\
+ \varepsilon \left( a_1 - \frac{\theta}{2} + ck^{-1}C_2 \right) (g \circ \Delta u)(t) + \varepsilon \left( \frac{\theta}{q} - ck^{-1}C_2 \right) \| u \|_q^q \\
+ \varepsilon \left( a_2 - \frac{\theta}{2} \left( 1 - \int_0^t g(s) ds \right) \right) \| \Delta u \|_2^2 \\
+ \varepsilon \left( \frac{\varepsilon q}{2} - \frac{\theta \varepsilon}{2} + ck^{-1}C_2 \right) \int_0^1 \| \nabla z(x, \rho, t) \|_2^2 d\rho + \varepsilon \left( q - \theta + ck^{-1}C_2 \right) H(t) \\
+ \varepsilon \sum_{i=1}^n \left\{ (a_3 - \frac{\theta}{p_i} + ck^{-1}C_2) \int_{\Omega} | u_{x_i} |^{p_i} dx \right\} + \varepsilon \delta d_1. \tag{5.9}
\]

First, we fix $\theta$ such that
\[
0 < \theta < \min \{ 2a_1, 2a_2, q \}.
\]
Second, we take $k > 0$ large enough such that
\[
\frac{\theta}{q} - ck^{-1}C_2 > 0.
\]

Once $k$ is fixed, we select $\varepsilon > 0$ small enough so that
\[
(1 - \sigma_i) - \frac{\varepsilon}{2C_0} k > 0, H^{1-\sigma_i}(0) + \varepsilon \int_{\Omega} u_0 u_1 dx > 0.
\]

Therefore, we obtain from (5.8), that
\[
L'(t) \geq C \left( \| u_i(t) \|_2^2 + (g \circ \Delta u)(t) + \int_0^1 \| \nabla z(x, \rho, t) \|_2^2 d\rho + \sum_{i=1}^n \int_{\Omega} | u_{x_i} |^{p_i} dx + \| u \|_q^q + H(t) \right). \tag{5.10}
\]

Here and in the sequel, $C$ denotes a generic positive constant. On the other hand, using the similar arguments in the work of Messaoudi [17] we get
\[
L^{\sigma_i}(t) \geq C \left( \| u_i(t) \|_2^2 + (g \circ \Delta u)(t) + \int_0^1 \| \nabla z(x, \rho, t) \|_2^2 d\rho + \sum_{i=1}^n \int_{\Omega} | u_{x_i} |^{p_i} dx + H(t) + \| u \|_q^q \right). \tag{5.11}
\]

Combining (5.9), and (5.10), we find that
\[
L'(t) \geq C L^{\sigma_i}(t), \text{ for } t \geq 0.
\]

A simple integration yields
\[
L^{\sigma_i}(t) \geq \frac{1}{L^{-\sigma_i}(0) - \frac{C\sigma_i}{1-\sigma_i}}, \text{ for } t \geq 0.
\]

Consequently, the solution of problem (4.1) – (4.4) blows up in finite time $T^*$ and
\[
T^* \leq \frac{1 - \sigma_i}{C\sigma_i L^{\sigma_i}(0)}.
\]
6 Conclusion

In this work, we are interested in a nonlinear problem of a viscoelastic plate equation with a polynomial source term in the presence of time delay. We show that the energy of any weak solution blows up in a finite time if the initial energy is nonpositive as well as positive. The delay effect is similar to memory processes that is important in the research of applied mathematics such as physics, and biological motivation. In future work, we will try to study the local existence of this problem with respect to some proposal conditions with a semi-groups method.
